ABOUT US

## A family-run software studio.

OmniMorph Private Limited was **incorporated in May 2025** in Midnapore, West Bengal. We are a small, family-run team, and the people you message are the people who write the code.

We build software end to end — the product, and the servers underneath it. When a client would rather own their infrastructure than rent it, we spec the hardware, set it up and hand over the keys.

We also run **a sister concern in Canada**, working on enterprise data and reporting contracts in the energy sector.

# One message, deployed.

Websites, apps, games, custom software — and the servers to run them.

Built end to end — design to deployment

Direct line to the engineers

You own the code, servers and data

Scope and price agreed in writing first

[omnimorph.org](https://omnimorph.org) · Midnapore, India · Est. 2025

# Software of every shape.

## ● Websites & web apps

Company sites, customer portals, dashboards and internal tools — with logins, billing and admin built in.

## ● Mobile & desktop apps

Android, iOS and Windows applications, sharing one codebase and one design where it makes sense.

## ● Games

Game builds and interactive 3D experiences, from prototype to a version you can put in front of players.

## ● Custom software & automation

The system your business actually runs on, plus the integrations that stop people copying data by hand.

## ● AI & assistants

Assistants that answer from your own documents and cite their sources — hosted on your machines when the data cannot travel.

## ● Servers & infrastructure

Hosting, deployment, backups and monitoring. On your own hardware, or on cloud you control.

# Four steps, no mystery.

## 01 Tell us the problem

A paragraph is enough. Write it the way you would to a colleague — no brief, no specification document.

## 02 We scope it

You get the whole scope in writing — what we build, what it costs, and how long it takes. Agreed before we start.

## 03 We build in the open

Working software you can open every few days, in a direct thread with the people building it.

## 04 You take the keys

Deployed, documented and handed over. Keep us on for maintenance, or run it in-house from day one.

## You own it.

The code, the servers and the data are yours at the end of the project — not licensed back to you, and not locked to us.

# Proof, not promises.

**Our own product.** A legal workspace for law firms: case and document management with an AI assistant that reads case files, drafts documents and handles the busywork. Files stay on the firm's own cloud drive. Web, Windows and Android.

**Enterprise data, Canada.** Our sister concern works as a project data and reporting contractor for a major North American nuclear power operator — data management, reporting and analytics on schedules and project performance.

**Everyday client work.** Websites, business applications and internal tools for small and mid-sized companies — built, deployed and maintained by the same team.
